

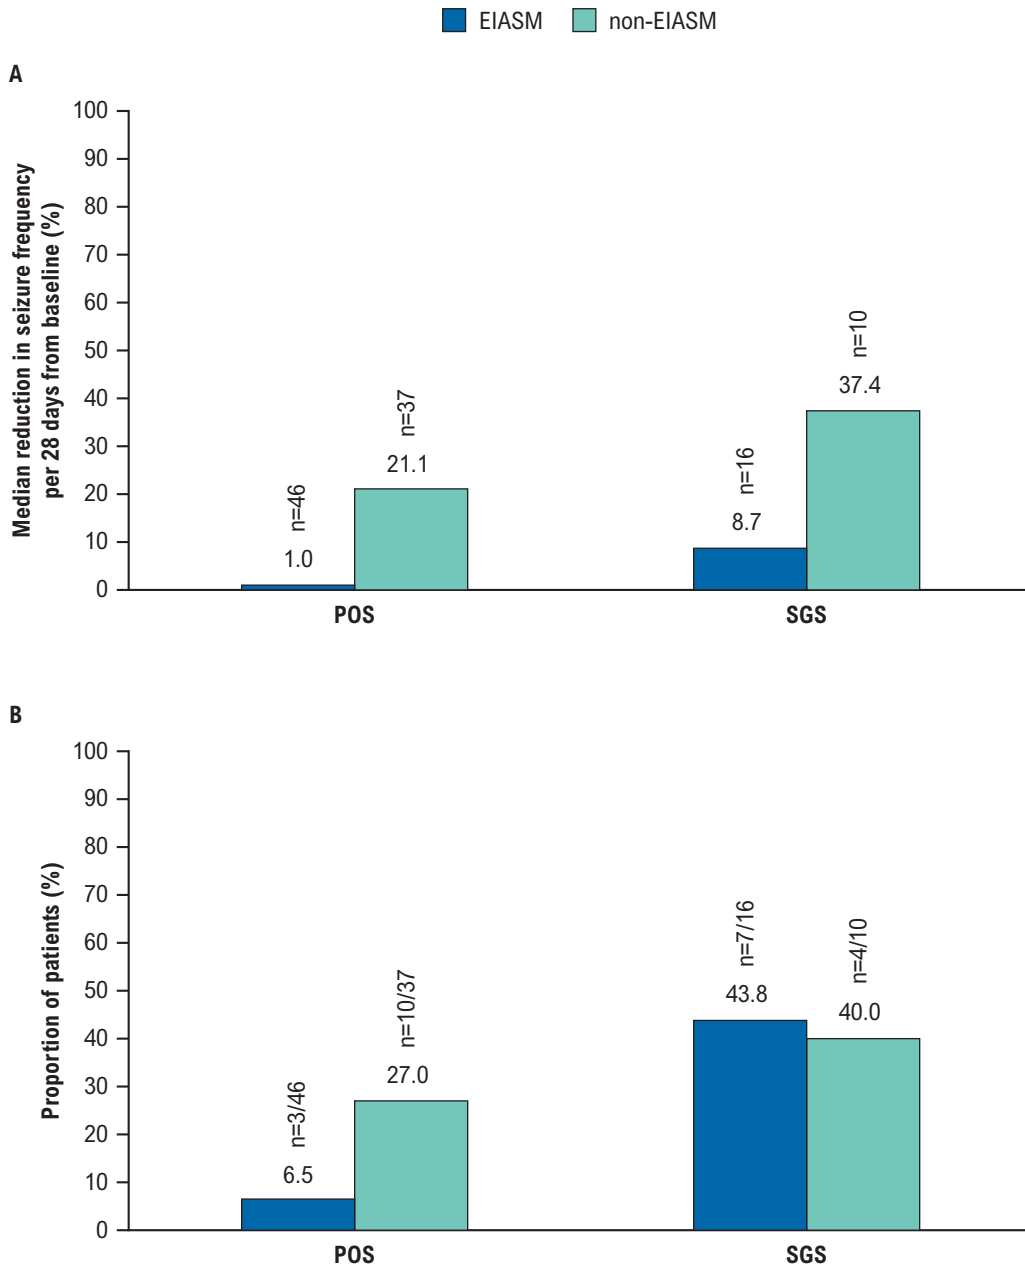

Figure 1. (A) Median percent reductions in seizure frequency per 28 days from baseline and (B) 50% responder rates in patients with POS and SGS who received a modal perampanel dose of 4 mg/day, stratified by EIASM^a use

^aEIASMs were defined as carbamazepine, phenytoin, and oxcarbazepine

EIASM, enzyme-inducing anti-seizure medication; POS, partial-onset seizures; SGS, secondarily generalized seizures
