

Figure 1: Forecasting performance results in a pseudo-prospective approach for all patients (leave-one-subject-out cross-validation approach). Bars represent mean values over ten network training runs, error bars indicate s.e.m. A, improvement over chance. B, sensitivity. C, time in warning. D, prediction horizon. E, number of seizures. F, number of hours in recording. * mark IoC values significantly larger than zero after correcting for multiple comparison.
